Exercício 4

Seja $f: \mathbb{R} \rightarrow \mathbb{R}$ definida por

$$F(x) = \int_0^x f(t) dt = -\frac{1}{2} + x^2 + x \sin(2x) + \frac{\cos(2x)}{2}$$

Como a função f é contínua, pelo Primeiro Teorema Fundamental do Cálculo, a função F é derivável e

$$F'(x) = f(x)$$

Como $F(x) = -\frac{1}{2} + x^2 + x \sin(2x) + \frac{\cos(2x)}{2}$, então

$$F'(x) = 2x + \cancel{\sin(2x)} + 2x \cos(2x) - \cancel{\sin(2x)}$$

$$\text{Obtemos assim que} \quad = 2x + 2x \cos(2x)$$

$$f(x) = 2x + 2x \cos(2x)$$

Então,

$$f\left(\frac{\pi}{4}\right) = 2\frac{\pi}{4} + 2\frac{\pi}{4} \cos\left(2\frac{\pi}{4}\right) = \frac{\pi}{2}$$

Derivando agora a função f , obtemos que

$$f'(x) = 2 + 2\cos(2x) - 4x \sin(2x)$$

Então,

$$f'\left(\frac{\pi}{4}\right) = 2 - 4\frac{\pi}{4} \sin\left(\frac{\pi}{2}\right) = 2 - \pi.$$

Exercício 5. Resolvido na aula TP

Exercício 6. Resolvido na aula TP

Exercício 7.

a) Como a função f é contínua, pelo Primeiro Teorema Fundamental do Cálculo, a função g é derivável e

$$g'(x) = f(x) - (2 + 4x)$$

Derivando a função g' (observe que f é derivável), obtemos

$$g''(x) = f'(x) - 4$$

b) Temos que:

$$g(0) = \int_0^0 f(t) dt - 0 = 0$$

$$g'(0) = f(0) - 2 = 2 - 2 = 0$$

$$g''(x) = f'(x) - 4 > 0, \quad \forall x \neq 0 \quad \text{porque } f'(x) > 4, \quad \forall x \neq 0 \quad \text{por hipótese}$$

c) Como $g''(x) > 0$ para todo o $x \neq 0$, a função g' é estritamente crescente (Notar que g' é contínua).
 Como $g'(0) = 0$ resulta que $g'(x) < 0$ para $x < 0$ e $g'(x) > 0$ para $x > 0$. Logo g é estritamente decrescente em $]-\infty, 0[$ e estritamente crescente em $]0, +\infty[$.
 Isto prova que em $x=0$ a função tem um mínimo absoluto de valor $g(0) = 0$. Por outras palavras, $g(x) > 0$ para todo $x \neq 0$. Esta desigualdade equivale a

$$\int_0^x f(t) dt > 2x + 2x^2 \text{ para todo o } x \neq 0$$

Exercício 8:

a) Temos que

$$F(x) = 0 \Leftrightarrow \int_1^{x^2} e^{\frac{1}{t^2}} dt = 0$$

Como a função $g(t) = e^{\frac{1}{t^2}} > 0$, $\forall t \in \mathbb{R}$, temos que

$$\int_a^b g(t) = 0 \text{ se e só se } b = a$$

$$\text{Então, } F(x) = 0 \Leftrightarrow x^2 = 1 \Leftrightarrow x = \pm 1$$

b) $\text{Dom}(f) = \mathbb{R}$ Temos que

$$F(-x) = \int_1^{(-x)^2} e^{\frac{1}{t^2}} dt = \int_1^{x^2} e^{\frac{1}{t^2}} dt = F(x), \quad \forall x \in \mathbb{R}$$

Então, F é uma função par

c) A função $f: \mathbb{R} \rightarrow \mathbb{R}$ é contínua
 $t \mapsto e^{t^2}$

Então, usando o Primeiro Teorema Fundamental do Cálculo, temos que a função

$$F(x) = \int_1^{x^2} e^{t^2} dt$$

é derivável e

$$F'(x) = e^{x^4} \cdot 2x, \quad x \in \mathbb{R}$$

Temos que

$$F'(x) = 0 \Leftrightarrow x = 0$$

		0	
F'	-	0	+
F	$\searrow$		$\nearrow$

Assim, F é estritamente decrescente no intervalo $]-\infty, 0[$ e estritamente crescente no intervalo $]0, +\infty[$.

Exercício 9

a) Por exemplo, a função $f: [0,1] \rightarrow \mathbb{R}$ definida por

$$f(x) = \begin{cases} 1 & \text{se } x \in \mathbb{Q} \cap [0,1] \\ 0 & \text{se } x \in (\mathbb{R} \setminus \mathbb{Q}) \cap [0,1] \end{cases}$$

b) Não existe. É suficiente observar que.

$$f \text{ derivável em } [0,1] \Rightarrow f \text{ contínua em } [0,1] \Rightarrow f \text{ integrável em } [0,1]$$

c) Não existe. É suficiente observar que.

$$f \text{ derivável em } [0,1] \Rightarrow f \text{ contínua em } [0,1] \Rightarrow f \text{ primitivável em } [0,1]$$

d) Ver o Exemplo 4 nos slides "Primitivas"

e) Por exemplo, a função $f: [0,1] \rightarrow \mathbb{R}$ definida por

$$f(x) = \begin{cases} 1 & \text{se } x \in [0, 1/2] \\ 0 & \text{se } x \in]1/2, 1] \end{cases}$$

Justificação:

- f não é Riemannável porque, pelo Teorema de Darboux, não pode ser a derivada de nenhuma função (com efeito, a função está definida num intervalo e não possui a propriedade do valor intermédio; além, pelo Teorema de Darboux, não pode ser a derivada de nenhuma função)
- f é integrável porque tem um número finito de pontos de descontinuidade

f) Por exemplo, a função $f: [0,1] \rightarrow \mathbb{R}$ definida por

$$f(x) = \begin{cases} 1 & \text{se } x \in \mathbb{Q} \cap [0,1] \\ -1 & \text{se } x \in (\mathbb{R} \setminus \mathbb{Q}) \cap [0,1] \end{cases}$$

Observamos que $|f|(x) = 1, \forall x \in \mathbb{R}$.

f) $x^2 + y^2 = 1$, $x^2 + y^2 = 4$

$$x^2 + y^2 = 1 \quad (\Rightarrow) \quad y^2 = 1 - x^2$$

$$(\Rightarrow) \quad y = \pm \sqrt{1 - x^2}$$
